Protecting Water Quality and Growing Corn Profitably

Many ways exist to improve the protection of our environment when using our products to economically produce corn. Pre-emergent herbicides and insecticides need to be applied in a conscientious manner, with thought on how to protect down-gradient resources. Are there endangered or threatened species nearby? Is there surface water that could receive field runoff? Is

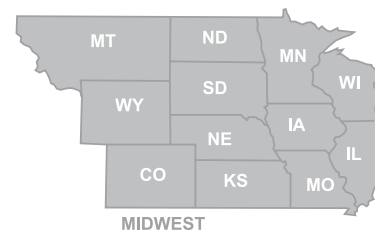

there shallow groundwater? To address these questions, growers are made aware of the potential problems and counseled on what is expected of them.

Bayer CropScience invests in research and outreach with our grower association partners to encourage the use of integrated, sustainable Best Management Practices to protect both sensitive

species and our water resources. Bayer CropScience does more than just say we have a stewardship program, they take an integrated approach by practicing this daily.

While mutual growth is important, protecting our environment and the corn growers' investments in valuable crop inputs is equally important.

Bayer CropScience, providing expertise in the field daily to ensure the protection of people, our natural resources and our environment.
